

# CARBON MARKETS INFRASTRUCTURE

## OPTIONS FOR TRACKING ARRANGEMENTS

HARI GADDE  
WORLD BANK  
OCT 30, 2024

# What is Carbon Market Infrastructure?

**Carbon market infrastructure** refers to the systems and platforms that facilitate the operation and functioning of carbon markets through the support of underlying frameworks and institutions. It encompasses various elements necessary for the monitoring, reporting, and verification of greenhouse gas emissions (GHG) reductions or removals, as well as the issuance, trading and tracking of carbon credits or allowances.

# Tracking under Article 6.2

Each participating party must “**have**”, or “**have access to**”, a **registry** for the purpose of tracking under Article 6.2 of the Paris Agreement. The registry records authorization, first transfer, use and other relevant actions relating to ITMOs.

## Article 6 Rulebook on tracking

### Article 6.2 Guidance (Decision 2/CMA.3, annex, chapter VI)

- Sets out the general requirements on tracking
- Tasks the UNFCCC Secretariat to implement an international registry

### Guidance on registries (Decision 6/CMA.4, annex I, I)

Specifies:

- Registry form, functions and processes
- Interoperability
- Guidance relating to international registry

# Article 6.2 registry functions

The Article 6.2 guidance specifies key requirements for the registry (Decision 2/CMA.3, annex, para. 29), which is further elaborated by the guidance for registries (Decision 6/CMA.4, annex I, chapter I).

Key requirements	Summary
Accounts and access	The registry must have <b>accounts</b> for ITMOs, as necessary. It must also provide access to the country and other entities with authorized access.
Recorded actions	The registry must be able to record the following <b>actions</b> : authorization, first transfer, transfer, acquisition, use towards NDCs, authorization for use towards OIMPs, and voluntary cancellation (including for OMGE, if applicable)
ITMO IDs	Each ITMO must have a <b>unique identifier (ID)</b> . The Article 6.2 guidance on registries sets out the minimum composition of the ITMO IDs.
Reporting	The registry must be implemented in a way that <b>enables reporting</b> of annual information consistent with the agreed electronic format (AEF).
Form	The registry's electronic, technical, and administrative arrangements must be based on " <b>software</b> " that enables tracking and recording of ITMOs.

# Considering possible options for registry

Countries suitable for this option	Registry options		
	Participating party registry		International registry (Operated by UNFCCC secretariat)
	Develop own registry	Use other available registry	
	<ul style="list-style-type: none"> <li>• Countries having in place domestic registry which serves similar functions</li> <li>• Countries intending to implement domestic CPIs which require a national registry</li> <li>• Countries having technical capacity and resources for operating its own system</li> </ul>	<ul style="list-style-type: none"> <li>• Countries receiving support from development partners who provide such service</li> <li>• Countries wishing to use registry for multiple functions in addition to Article 6 without developing own registry (subject to the functions provide by each registry)</li> <li>• Countries wishing to reduce cost in operating the system by themselves</li> </ul>	<ul style="list-style-type: none"> <li>• Countries intending to use the registry for the sole purpose of Article 6</li> <li>• Countries with limited capacity and resources</li> <li>• Countries intending to use international registry in addition to their own registries to facilitate Article 6 implementation</li> </ul>

# Country's selection of registry for ITMOs tracking

Order: Alphabetical

Name of country	Registry for tracking ITMOs	Type of registry		International registry	Link
		Participating party registry			
		Develop own registry	Use other available registry		
Bhutan <sup>2</sup>	National Carbon Registry	✓			
Ghana <sup>1</sup>	Ghana Carbon Registry (GCR)	✓			<a href="#">Click here</a>
Guyana <sup>1</sup>	Under development (Currently use ART TREES Registry)	Under development	✓		
Japan <sup>2</sup>	JCM Registry	✓			<a href="#">Click here</a>
Suriname <sup>1</sup>	National Registry / International Registry for REDD+ Results	✓			<a href="#">Click here</a>
Switzerland <sup>1</sup>	Swiss Emissions Trading Registry	✓			<a href="#">Click here</a>
Thailand <sup>1</sup>	Thailand Carbon Credit Registry	✓			<a href="#">Click here</a>
Vanuatu <sup>1</sup>	National Carbon Registry	✓			<a href="#">Click here</a>

Update as of March 28, 2024.

**Note:** The above list is an initial list. A6IP Center will collect and regularly update the list to include additional cases.

# Example list of other available registries (1):

## Registries provided by development partners and countries

Registry name	Provider	Brief description	Link for further information
National Core Carbon Registry and National Enhanced Carbon Registry	World Bank	Build on open-source software, provides national-level registry infrastructure enabling member countries to issue digital carbon assets.	<a href="#">Click here</a>
National Carbon Credit Registry	UNDP	A digital public good (DPG), enables carbon credit tracking transactions from mitigation activities. Any country can customize and deploy a local version of the registry.	<a href="#">Click here</a>
JCM Registry	Ministry of Environment, Japan	Partner countries may request the use of the JCM Registry for Article 6.2 cooperation.	<a href="#">Click here</a>

# Example of off-the-shelf registry

## For capacity-building and training

# Testing the World Bank's Open-source "Core Registry"

An open-source registry system with core functionalities for Article 6 tracking requirements and automatic sync-in to the Climate Action Data Trust (CAD Trust).

## Tracking and accounting for article 6 requirements

Leveraging common data model and automatic sync to the Climate Action Data Trust, which aggregates and harmonizes data from connected country registries.

## Issuance and transaction of carbon credits

Through blockchain and tokenization technology, this transaction layer enables the creation of digital carbon assets – a digital record or representation of a traditional carbon credit

## Fostering capacity-building and experiential learning

Learning between all actors involved on the needs, technical and functional requirements, and governance and business models

The screenshot shows the 'REGISTRY' section of the application. It features a search bar at the top, followed by a navigation menu with options: REGISTRY, TOKENIZATION, EXPLORER, GLOSSARY, MY REGISTRY, MY PROJECTS, MY UNITS, MY FILES, and MY ORGANIZATION. The main content area displays a table with columns for 'Current Registry', 'Project Id', 'Project Name', 'Project Developer', and 'Sector'. The table is filtered to show 'COMMITTED' projects. The data rows are as follows:

Current Registry	Project Id	Project Name	Project Developer	Sector
CDM Registry	GP100	Greenfield Pr...	Grasslands LLC	Public admini...
CDM Registry	HYD100	Hydropower ...	Hydro Guys LLC	Electricity; ga...
CDM Registry	HDP100	Hydropower ...	Dam builders L...	Electricity; ga...

# Core Registry – Key Functionalities

Term	Definition	Usage
<b>Digital Carbon Assets</b>	A digital record of a traditional carbon credit that holds the same values and metadata as the traditional offset captured on a distributed ledger technology (DLT).	Carbon credits are created by the registry as the tradeable instrument for the carbon offset. These are sent to project developers, or custodied by the registry.
 <b>Climate Tokenization Engine</b>	Functionality used in module 2 of Core Registry which allows the registry administrator to create and view existing carbon credits.	Registry administrator will view existing units in the register and decide which units to issue. This is the first step in the carbon credit lifecycle.
 <b>Climate Wallet</b>	Functionality Core Registry which enables the transaction of carbon credits.	Project developers and buyers of carbon credits will use the Climate Wallet to view, send, and retire their held carbon credits.
 <b>Climate Explorer</b>	Functionality of Core Registry which allows the registry administrator to track all carbon credits activity that occurs on the blockchain.	Registry administrators leverage this functionality to confidently track their issued carbon credits.
<b>Carbon Credit retirement</b>	Describes the final stage of the carbon credit, where it is provably removed on chain, creating a permanent record of the offset being used as a claim.	Buyers of carbon credits will use the Climate Wallet to retire a carbon credit, providing an anonymized - yet provable - record of the claim.

# Training and Capacity-Building To Deploy the Registry

## Training and testing the opensource registry system

### Phase 1

#### Training

During this phase, participants will use a test environment, provided by the World Bank, to be able to test the Core Registry.

Participants will be provided with test scripts which will guide the testing process.

Feedback will be collected based on testing results.

2-4 Weeks

### Phase 2

#### Feedback Assessment

After testing, the World Bank will guide a needs assessment session which is aimed at uncovering the specific needs of the country registry.

A questionnaire will guide the discussion to understand what gaps exist (if any) between the current Core Registry and what is needed by the country.

1-2 Weeks

*If the government opts to adopt this registry system as their national carbon registry, they can proceed to phase 3.*

## Deployment of national carbon registry

### Phase 3

#### Deployment

After the feedback assessment phase, countries can decide to deploy the Core Registry.

Once the decision to deploy has been made, the existing software can be deployed and used by the participant.

1-2 Weeks

Retrieving socket ID

# High-Level Data Model of the Registry

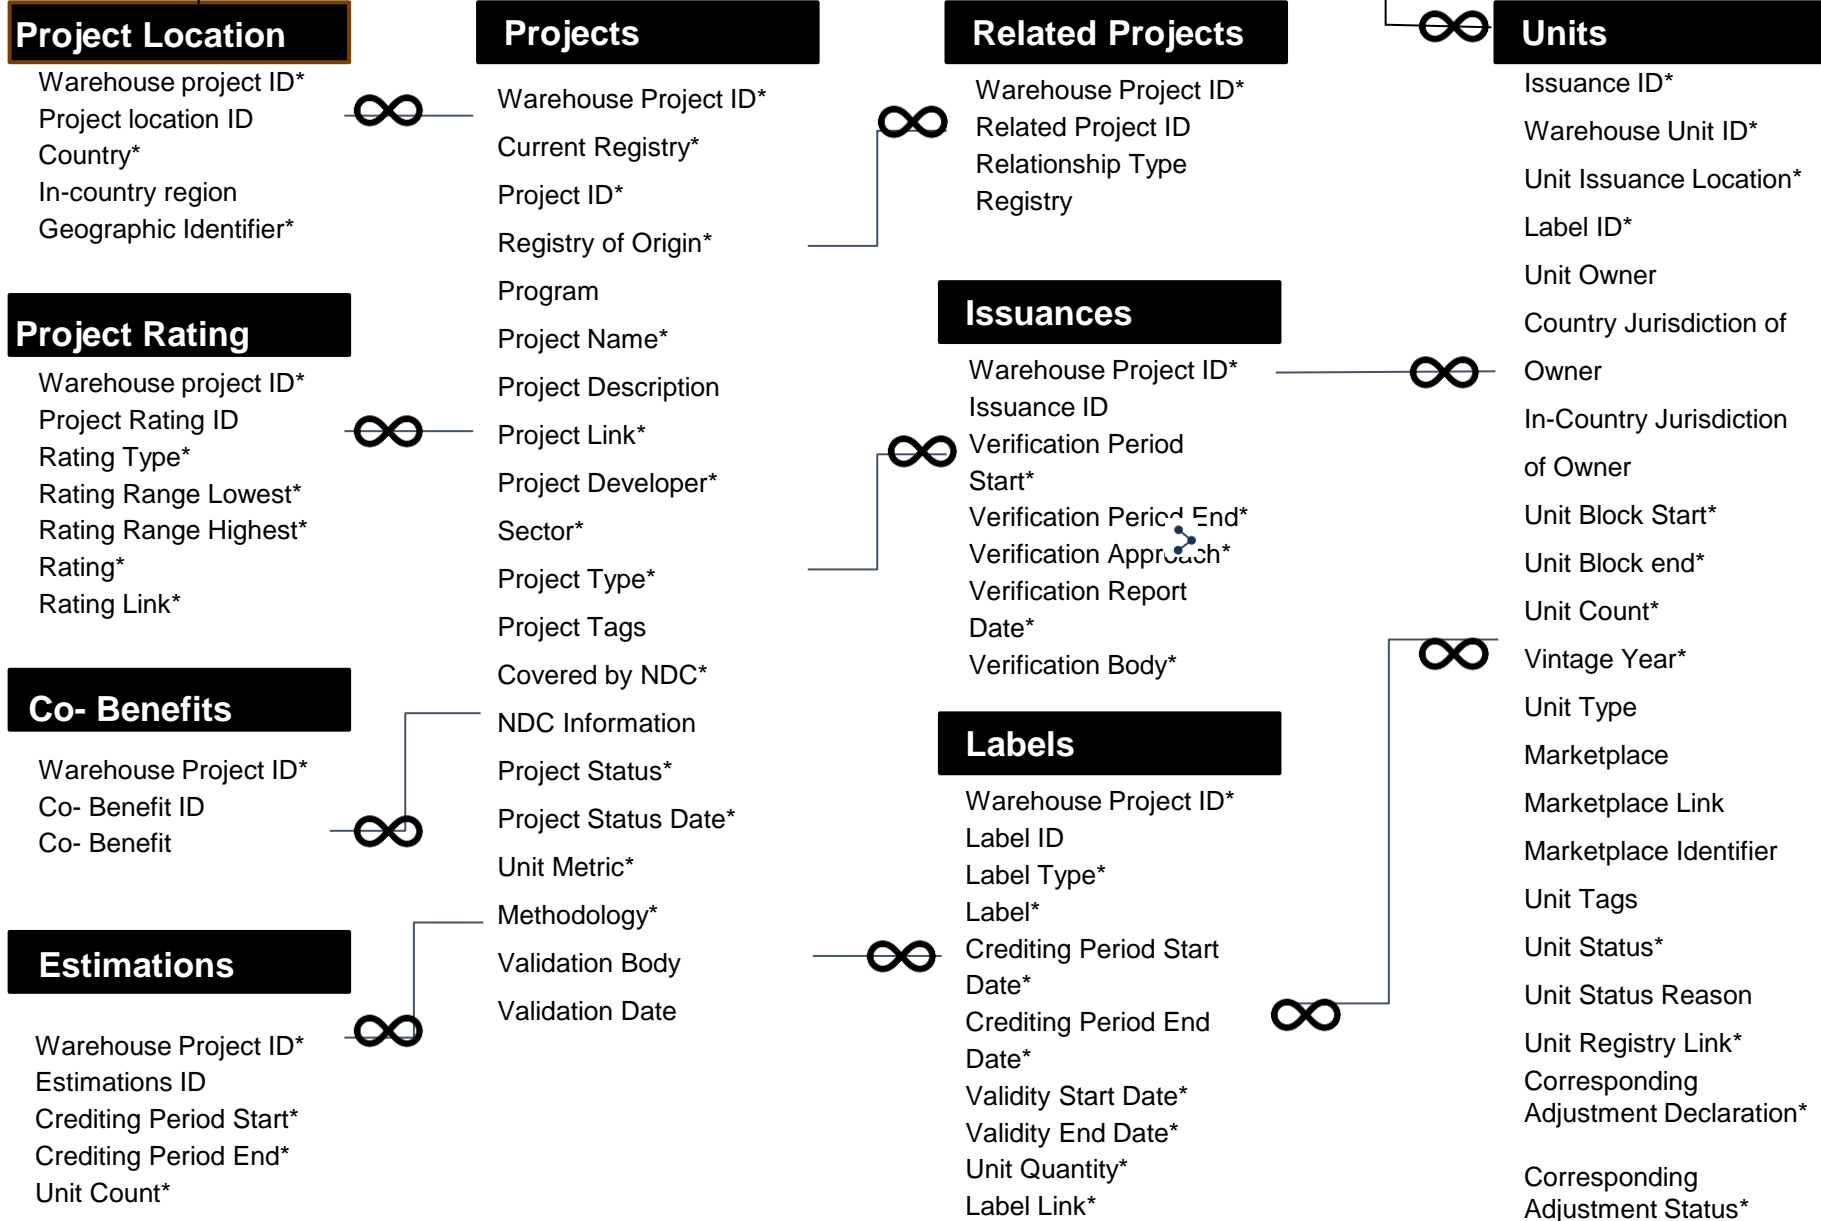

## Governance

To enhance consistency in carbon projects and their related data, CAD Trust will oversee and manage the values in specific data fields.

This approach is designed to streamline reporting rather than impose restrictions.

# Registry Data Model - Table and Field data

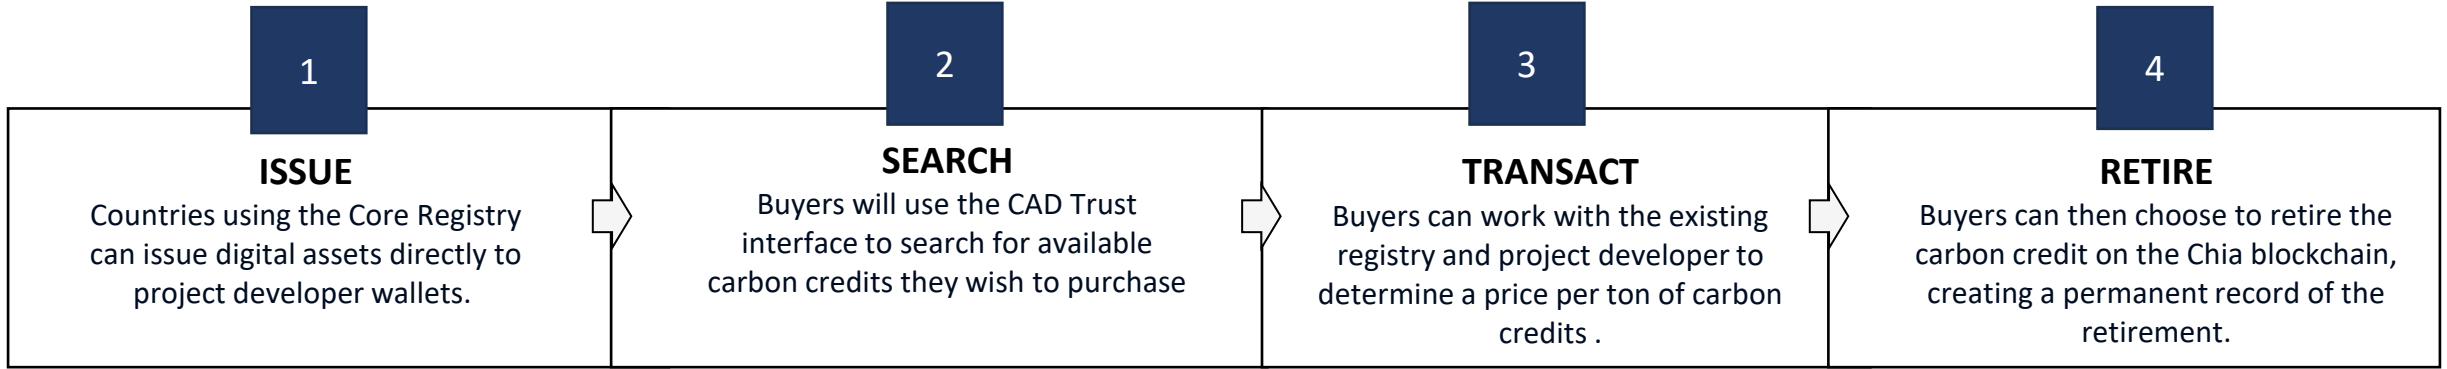

## Governance Picklist

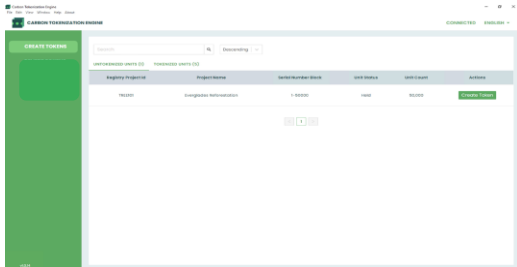

- Registry values
- Project Sector values
- Project Status values
- Project Type values
- Methodology values
- Unit Metric values
- Validation Body values
- Country values
- Rating Type values
- Unit Type values
- Unit Status values
- Corresponding Adjustment Declaration values
- Corresponding Adjustment Status values
- Related Project Relationship type values
- Label Type values
- Verification Body values
- Tag values
- Co-Benefit values

**Each ID is globally unique, meaning no two organizations will generate the same ID for any table**

# Process Flow: Transaction of Carbon Credits

## Core Registry

Countries will leverage the Core Registry to create digital carbon assets. These carbon credits will be issued on the blockchain.

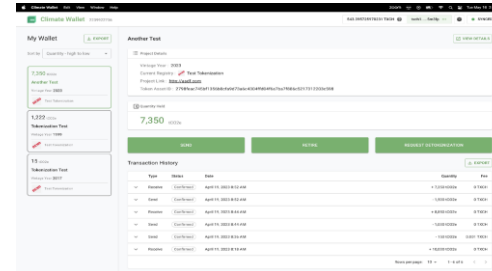

Additionally, the tokenization will be recorded in CAD Trust so that potential buyers may find the carbon credit.

## CADT Observer Node

Buyers will search for existing carbon credits on the CADT observer node.

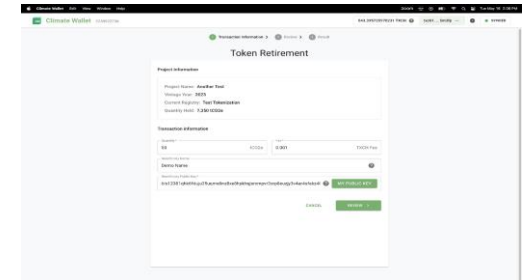

## Climate Wallet

Once a price has been agreed upon, the project developer will send the carbon credits to the buyer.

This transaction will be a permanent record on the Chia blockchain.

## Climate Wallet

The buyer can then choose to retire the carbon credits using the Climate Wallet.

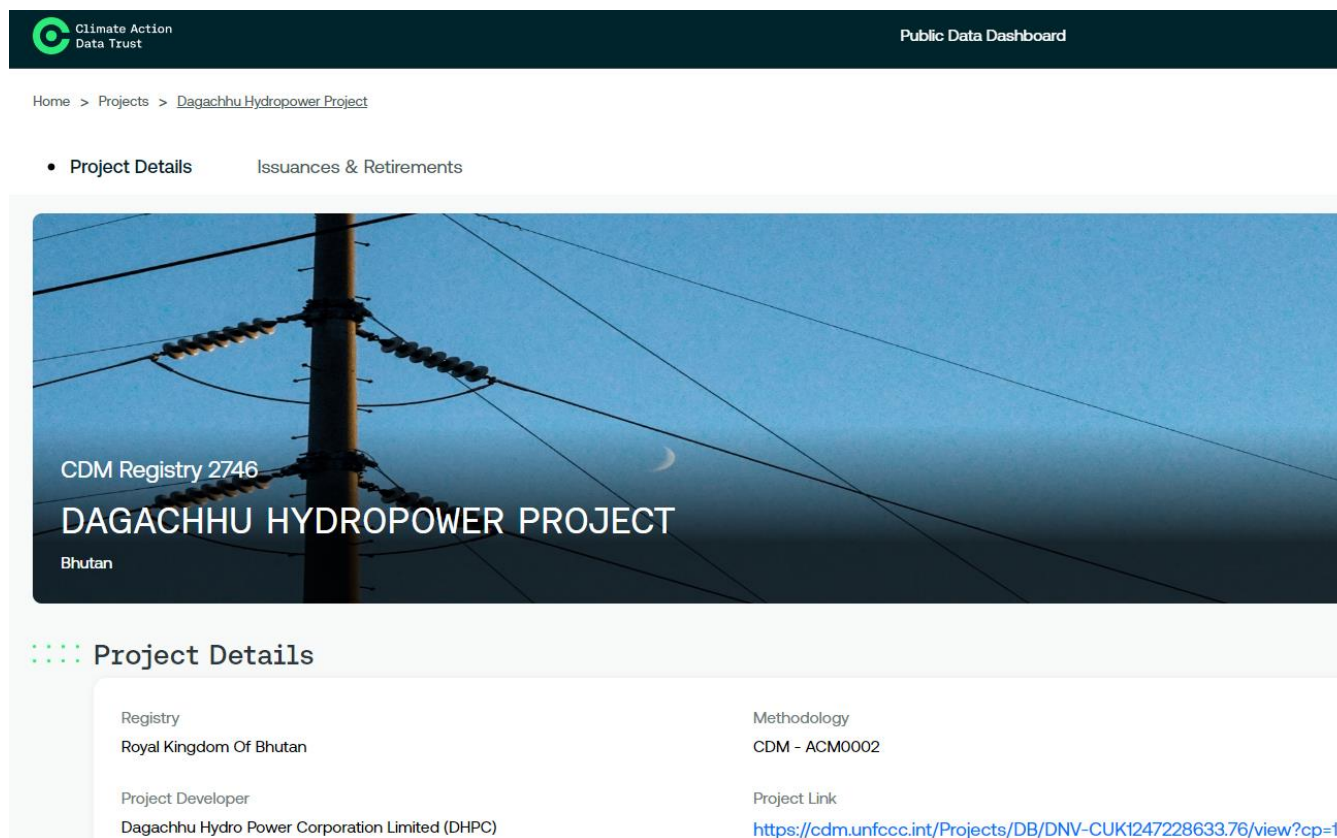

This will destroy the existing carbon credit and create a permanent record of the retirement, so that the buyer is ALWAYS able to prove the retirement.

# Example

## Bhutan's Registry Data Broadcasted in the CAD Trust

- Users can now access, compare and use carbon markets data on a free, open-source platform from connected country and standard registries.
